

ONS

OPTICAL NAVIGATION SYSTEM

When GPS dies, the drone goes blind.

Dual-use optical navigation · Field-tested · Pre-Seed · \$500K

GPS jamming makes every mission a coin flip.

Jamming is constant — and the demand is already ordered.

46,000

GNSS jamming events recorded

30,000+

Strike drones ordered, Ukraine

Zelensky / Umerov · 2025

EW jams or spoofs GPS. Drones lose coordinates, drift off course, crash, or become targets. Every platform without a satellite-independent position source is a single point of failure.

GPS-denied nav is becoming a requirement.

Capital, regulation, and demand are converging through 2026.

Optical terrain-matching replaces GPS.

Camera + onboard compute match live terrain to a pre-loaded reference map, fused with IMU.

01 Absolute position, no drift

Route-corridor map loaded pre-flight. Map-matching gives absolute coordinates — no satellite, no cumulative inertial drift.

02 Field-proven accuracy

17 m median error in real flight tests at ~200 m AGL — better than the 20–50 m mid-strike needs. Down to ~3 m in best conditions.

03 Plug-in module

Feeds the autopilot over MAVLink as an external GPS source. Works with open-standard autopilots (ArduPilot / PX4) — no operator retraining.

04 Zero RF signature

Passive optical sensing only. Nothing radiates, so EW has nothing to detect, jam, or home in on.

Algorithm live and flight-tested on commodity cameras · working MVP in 6–9 months.

New test data: we beat the mission spec.

Real flights, real routes, commodity camera — verified against GPS ground truth.

17 m

Median position error

Full route, ~200 m AGL, 25 m/s

~3 m

20–50 m

What the mission needs

Mid-strike req. — already exceeded

WHAT THIS MEANS

Multiple flights at different altitudes matched live video to the reference map at 17 m median error — on a consumer-grade camera. **Mid-strike missions need 20–50 m: we already exceed the requirement, before IMU-fusion tuning and model training on accumulated flight data. Target: ≤5 m CEP at 150–200 km.**

Module chosen — manufacturing started.

Product-form decision made: integrated hardware module. First prototype batch is in manufacturing now.

INSIDE THE MODULE

- **Optical camera** — day-mode now, night-mode on roadmap
- **Onboard compute** — runs the matching algorithm in flight
- **Encrypted map storage** — reference maps stay inside the box — IP protected
- **MAVLink interface** — presents to the autopilot as an external GPS receiver
- **IMU fusion** — uses platform IMU; tolerates 10–20° camera misalignment

PRODUCTION STATUS · AUG 2026

NOW	First prototype units in assembly — 3D-printed enclosure, branded, flight-ready
END AUG	3 units built and flying at a partner test range near Lviv
NEXT	10-unit batch for OEM field trials on partner ISR aircraft (100 km linear routes)
BOM	\$1,000–1,500 per unit at prototype volumes — compute, 1 TB storage, camera, power & cooling

Why hardware: OEMs asked for a calibrated, install-and-fly box — and onboard encrypted maps beat a web platform on security.

The approach works — our map IP is the moat.

Matching algorithms will commoditise. Sovereign, fresh, GIS-grade maps will not.

17 m

ONS — own field result, Aug 2026

Median error, real flights vs GPS ground truth · target ≤ 5 m CEP

52 m

Independent benchmark (Theseus)

Median, 564 km optical-nav test, Mar 2026 — validates the category, not our metric

Sovereign map layer

Own GIS-grade reference maps per theatre — no Maxar lock-in, available where US primes can't go

Fresh AO layer

Annual subscription keeps the area-of-operations layer current as terrain changes

Honest confidence

Position + confidence output and an honest “no fix” — a slot no competitor publishes

Career-long nav team

45+ combined years in geospatial, navigation and UAV systems; national-scale cartography exit

A \$334M niche inside a \$4.8B PNT market.

≈10,000 nav units per month needed on the UA front alone — validated in 20+ OEM interviews.

\$4.8B

TAM · 2030

Assured-PNT market · 24–29% CAGR · Mordor 2025 / TBRC 2026

\$334M

SAM · 2033

GPS-denied drone-nav niche, from \$149M (2024) · SRI 2026

\$6M

SOM · Year 1

2,000 units × \$3,000 · bottom-up, ONS est.

Demand signal from the field: OEM interviews (Jul–Aug 2026) put UA demand at ~10,000 units/month for mid- and deep-strike platforms alone — and ~300 units/month are sellable today through our existing warm OEM network.

Defence beachhead first, civil dual-use next.

Same software stack across platform classes — once MVP validates.

Civil dual-use: Assured PNT · Logistics / BVLOS · Aviation backup · Emergency response.

Module plus recurring map subscription.

Pricing validated in 20+ OEM & operator interviews, Jul–Aug 2026.

Module + annual maps

\$3,000

Per-unit benchmark price + recurring map subscription. BOM \$1.0–1.5K leaves hardware margin plus software-grade recurring revenue.

Premium accuracy tier

3–5 m

Correctors / last-mile precision for platforms where accuracy beats price — the price-insensitive segment.

OEM integrators

Royalty

Per-platform royalty + IP licensing for primes integrating the stack at scale.

Y1 benchmark: 2,000 units × \$3,000 = \$6M. Interviews confirm a two-tier market — price-critical mass (mid-strike) and price-insensitive precision — and the module + subscription model serves both.

Hardware in production, MVP in 6–9 months.

Each phase converts capital into measurable validation. Path to Seed is clear.

PHASE 1 · DONE

Core algorithm

- Map-matching algorithm live
- Field flights: 17 m median, ~3 m best
- 300 ms/frame processing

Bootstrapped

PHASE 2 · NOW

Hardware prototypes

- First units in manufacturing
- 3 units flying by end of Aug
- MAVLink external-GPS integration
- Test range secured (Lviv)

Pre-Seed \$500K

PHASE 3 · M6–M9

Working MVP

- GPS-free flight validated
- ≤ 5 m CEP target met
- 10-unit batch in OEM trials
- Night-mode prototype

+ UK DASA Open Call

PHASE 4 · M9–M12

Seed round

- LOI $\times$ 3–5 from UA OEMs
- DASA / DIANA decision
- Seed raise launched

Seed \$3M–\$3.5M target

Three founders. Five years together.
